*Assemblée Générale  
Décembre 2022*

*Algemene Vergadering  
December 2022*

XLH Belgium aims to contribute to the well-being of people with XLH and their relatives. It pursues the following actions:

*Gathering information and explanations about XLH, the treatments and therapies recommended, and all the available means of help.*

*Communicating and sharing this information and explanations with people with the disease*

*Form a national and international support network*

*Representing patients and their families to medical, political, social security and other authorities.*

XLH Belgium a pour but de contribuer au bien-être des personnes atteintes de XLH et de leurs proches. Elle poursuit les actions suivantes :

Recueillir des informations et des explications sur le XLH, les traitements et thérapies préconisés, et tous les moyens d'aide disponibles.

Communiquer et partager ces informations et explications avec les personnes atteintes de la maladie.

Former un réseau de soutien national et international

Représenter les patients et leurs familles auprès des autorités médicales, politiques, de sécurité sociale, etc.

XLH Belgium wil bijdragen tot het welzijn van mensen met XLH en hun verwanten. Zij voert de volgende acties:

Het verzamelen van informatie en uitleg over XLH, de aanbevolen behandelingen en therapieën, en alle beschikbare hulpmiddelen.

Het communiceren en delen van deze informatie en uitleg met mensen met de ziekte

Een nationaal en internationaal ondersteuningsnetwerk vormen

Patiënten en hun families vertegenwoordigen bij medische, politieke, sociale zekerheids- en andere instanties

Association of patients with hypophosphatemic rickets

X-Linked Hypophosphatemia (XLH) is a rare genetic disorder that affects about one in 20,000 people. The key characteristic of XLH is a low level of phosphate in the blood, called Hypophosphatemia. When a person is affected by XLH, their kidneys do not properly handle Vitamin D and phosphate. This causes a variety of symptoms and disorders that usually affect their bones and teeth.

L'association participe à l'évaluation de Crys vita par les autorités de santé. Notre association sera brièvement consultée par l'INAMI dans le cadre de la revue du dossier déposé par Kyowa Kirin pour le remboursement de Crys vita chez les adultes. Les supports qui seront présentés sont en annexe de cette présentation

De vereniging is betrokken bij de evaluatie van Crys vita door de gezondheidsautoriteiten. Onze vereniging zal kort worden geraadpleegd door het RIZIV in het kader van de herziening van het door Kyowa Kirin ingediende dossier voor de terugbetaling van Crys vita bij volwassenen. De presentatie materialen zijn bij dit document gevoegd,

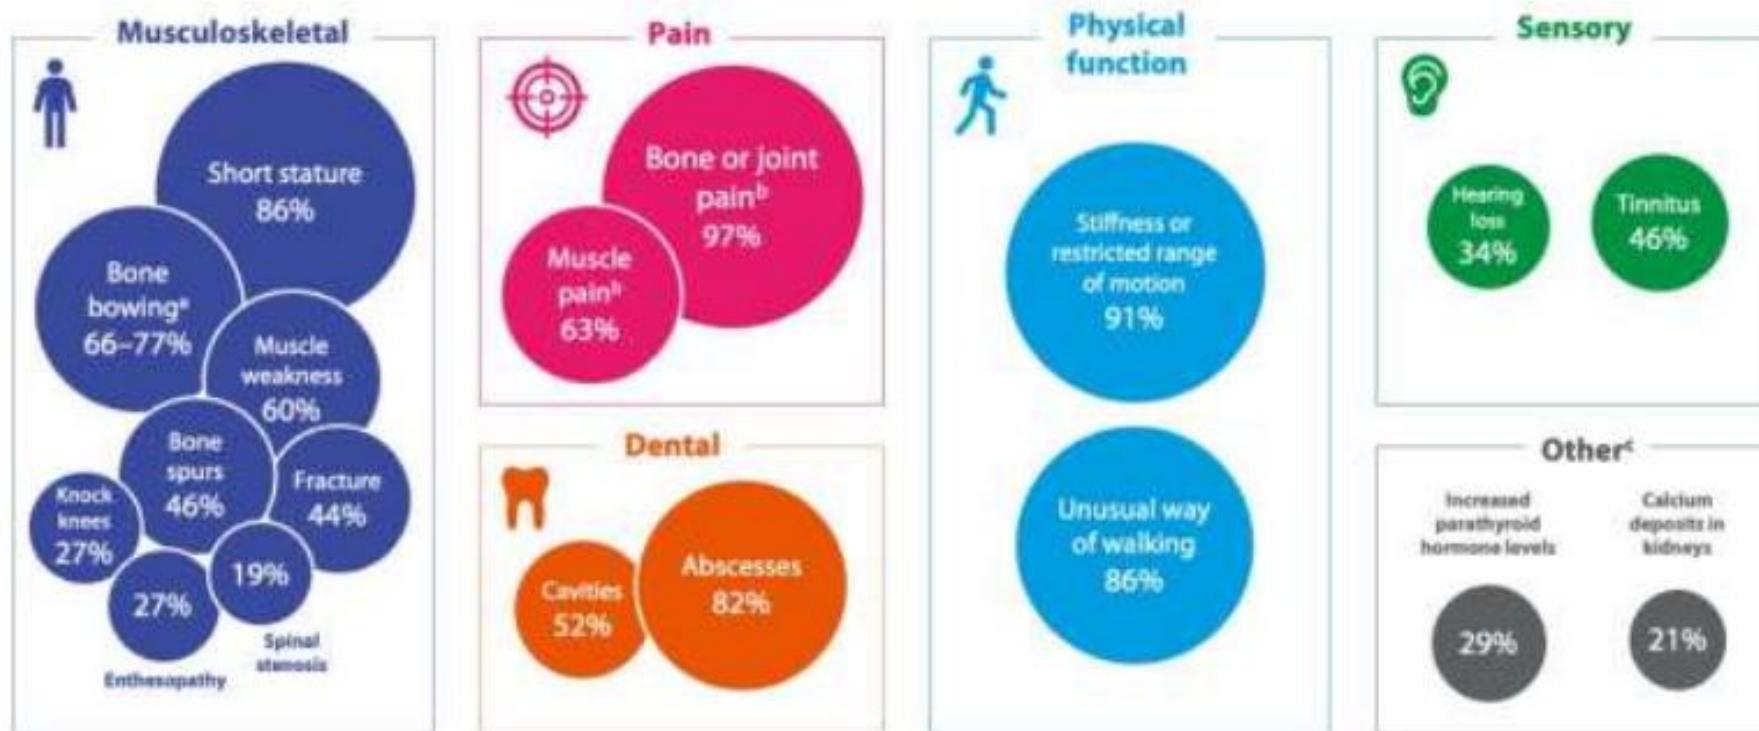

The association is involved in the evaluation of Crys vita by the health authorities. Our association will be briefly consulted by the INAMI in the framework of the review of the file submitted by Kyowa Kirin for the reimbursement of Crys vita in adults. The presentation material is attached in the annex of this slide deck,

## PATIENT PERSPECTIVE

A better description of XLH in adults:

- X-linked hypophosphatemia (XLH) is a rare, lifelong, progressive disease characterised by renal phosphate wasting and abnormal bone mineralization (SH Lo et al, 2020)
- **X-Linked Hypophosphatemia, Not Only a Skeletal Disease But Also a Chronic Inflammatory State (Meaux et al., 2022)**

## The unrecognized burden of XLH in adults

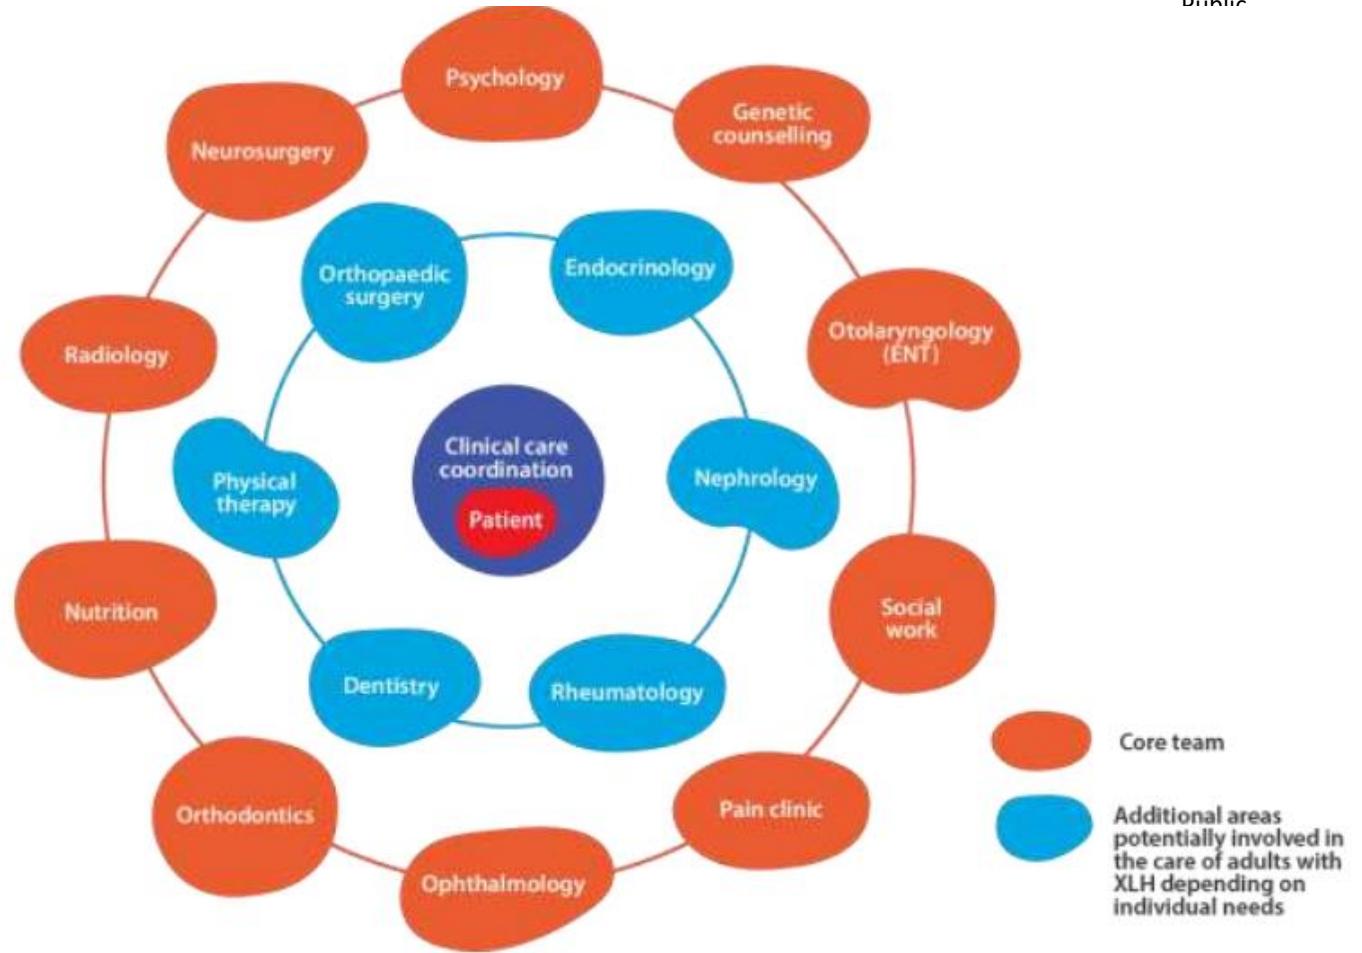

**Figure 1. Proportion of adults who reported experiencing signs and symptoms associated with XLH.**

Data shown are from the largest published study on burden of disease in adults with XLH (n = 232).<sup>3</sup>

<sup>a</sup>66% of adults experienced bowing of the thigh bone; 77% experienced bowing of the long bones of the lower leg. <sup>b</sup>Pain experienced in the year prior to participating in the survey. <sup>c</sup>Conditions thought to be related to use of vitamin D and phosphate-replacement therapies.

Source: The unrecognized burden of XLH in adults. A call to action – white paper P.Harvengt, L.Seefried, M Smith, R. Keen (2020).

XLH requires a multidisciplinary approach

BUT...

Do we have appropriate access to the specialities that we need ?

- Pain killers: up to opioids
- Dentistry: nothing more than general population
- Physiotherapy: nothing more than general population
- Endocrinology: nothing more than the general population
- .....

We need better access to healthcare !!!

### Financial pressure

- Medical and dental bills
- Insurance
- Home modifications
- Special equipment

### Challenges at home

- Support needed from family and friends
- Mental health support
- Family planning

### Challenges at work

- Type of work / career
- Company support
- Time off / flexible working
- Early retirement

### Lack of awareness

- Low awareness among healthcare professionals, policy makers and the general public
- Lack of resources for patients

### Pain

- Painful symptoms that interfere with daily life
- Need for ongoing pain management

### Limited mobility

- Progressive deterioration of physical function
- Difficulty getting around
- Need for mobility aids

**Figure 5. Factors contributing to the burden of XLH in adulthood.**

## Conclusions:

- Burden of disease in adults is significant (similar to other bone disease like OI)
- Conventional treatment is not a realistic option (QoL- and endocrinology-related)
- What we need
- better access to treatment (as a whole)
  - A reasonable price structure for the new treatment options
  - More than 5 minutes hearing (cfr level of expertise available from patient experts)

## Association de patients atteints de rachitisme hypophosphatémique

L'hypophosphatémie liée à l'X (XLH) est une maladie génétique rare qui touche environ une personne sur 20 000. La principale caractéristique de la XLH est un faible taux de phosphate dans le sang, appelé hypophosphatémie. Lorsqu'une personne est atteinte de XLH, ses reins ne traitent pas correctement la vitamine D et le phosphate. Cela provoque une variété de symptômes et de troubles qui affectent généralement les os et les dents.

## Vereniging van patiënten met hypofosfatemische rachitis

X-gebonden hypofosfatemie (XLH) is een zeldzame genetische aandoening die bij ongeveer één op de 20.000 mensen voorkomt. Het belangrijkste kenmerk van XLH is een laag fosfaatgehalte in het bloed, Hypofosfatemie genoemd. Als iemand lijdt aan XLH, kunnen de nieren niet goed omgaan met vitamine D en fosfaat. Dit veroorzaakt een verscheidenheid aan symptomen en aandoeningen die meestal gevolgen hebben voor hun botten en tanden.
